Vamshi - CSV Homework Debugging Journey (Expanded)

Detailed record of the homework, mistakes, debugging process, and lessons learned.

Homework Questions

- Find the number of matches played in 2009.
- Print winners of each season.
- Find the number of matches where toss winner and match winner are the same.

Difficulties Faced

- Creating a CSV file using Apple Numbers on macOS.
- Understanding CSV export settings.
- KeyError while accessing CSV columns.
- Confusion between SEASON and season headers.
- Verifying file paths and execution from Terminal.
- Understanding DictReader header mapping.

Most Important Debugging Story

- Program raised KeyError: 'SEASON'.
- Changed to season but still got KeyError.
- Verified that matches.csv existed in the correct folder.
- Checked the spreadsheet and headers looked correct.
- Used print(reader.fieldnames) for debugging.
- Output was ['Table 1'].
- Identified that Apple Numbers exported the table title as the CSV header.
- Re-exported/fixed CSV export settings.
- CSV headers were read correctly afterwards.
- Question 1 executed successfully.

Lessons Learned

- Always inspect reader.fieldnames when DictReader gives KeyError.
- Export settings can affect CSV structure.
- Read error messages carefully before changing code.
- Debugging is a step-by-step process.
- Not every error is caused by Python code; sometimes the data file is the problem.

Achievements Completed Today

- File Handling
- CSV Reader

- CSV Writer
- DictReader
- DictWriter
- Python execution from macOS Terminal
- Completed all 3 homework questions successfully
